                                                                                                                                                                                                                                                                                                                                                                                                                                                   ALTERNATIVE PRODUCTS: TWO ISOFORMS ARE PRODUCED BY ALTERNATIVE SPLICING. THE 2 FORMS DIFFER ONLY IN THEIR C-TERMINAL AMINO ACIDS. THE LONGER FORM PRESENTS AN EXTENSION, A POTENTIAL TRANSMEMBRANE DOMAIN, WHICH MAY HAVE AN IMPORTANT FUNCTIONAL ROLE. DEVELOPMENTAL STACE: ISOFORM 2 (LONG FORM) IS EXPRESSED ONLY IN EARLY STAGES OF EMBRYONIC DEVELOPMENT (CYSTS), WHILE ISOFORM 1 (SHORT FORM) IS ALSO FOUND IN LATER EMBRYONIC STAGES AND ADULTS. SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY

"Nucleotide sequence of ATPASE subunit 6 gene of maize mitochondria."

Plant Physiol. 79:914-919 (1985).

-I. FUNCTION: KEY COMPONENT OF THE PROTON CHANNEL; IT MAY PLAY A
DIRECT ROLE IN THE TRANSLOCATION OF PROTONS ACROSS THE MEMBRANE.

-I. SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC

CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE

SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(0)

HAS THREE MAIN SUBUNITS: A, B AND C.

I. SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-I. SIMILARITY: BELONGS TO THE ATPASE A CHAIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mitochondria.";

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             infections, acne, hypertension, cirrhosis and cancer. The nucleotide sequences (II) encoding (I) may be used as probes or primers. Probes may be used to identify and purify nucleic acids and so may be used in diagnosis to detect the presence of (II) in a sample. Primers are useful for amplifying DNA by polymerase chain reaction (PCR). (II) may also be used to prepare an organism that is either chill resistant or that accumulates GLA or metabolites derived from GLA. Hybridizing DNA molecules may be used as anti-sense molecules to alter the expression of (II) by binding to it and preventing transcription. Hybridizing DNA molecules may also be provided as ribozymes which regulate expression by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            raise and select antibodies (which may be used in immunoassays, and diagnostic tests to detect the presence of (I) in a sample, or to purify (I)) or as a selectable marker for transformation, especially transformations involving plants. (I) can be used to produce gammalinolenic acid (GLA) (and derivatives of it), which is a high value plant fatty acid that is widely used in medicine for the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is Caenorhabditis elegans Delta 6 desaturase, designated CeD6.1. Desaturase enzymes (I) may be used as immunogens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC the invention. The specification describes methods for desaturating a confirmation of the producing a desaturated fatty acid by expressing concerns the introduces a double bond carbons 6 and 7 from the carboxyl end of a fatty acid molecule. The enzyme can be used for desaturating fatty cards. The enzyme can be used to produce polyunsaturated fatty acids, which can be used for treating malnutrition, in pharmaceutical compositions, in cosmetics or in animal feed. The polyunsaturated fatty cards can be used for treating e.g. restenosis after angioplasty, compositions, in cosmetics or in animal feed. The polyunsaturated fatty cards can be used for treating e.g. restenosis after angioplasty, corresponding to the composition, rheumatoid arthritis, asthma, psoriasis, cancer, diabetes corrected are reduce blood pressure. They can also be used to inhibit confidence blood pressure. They can also be used to inhibit proliferation of vessel wall smooth muscle and fibrous tissue, creduce or prevent gastro-intestinal bleeding and other side effects caused by non-steroidal anti-inflammatory drugs, prevent or treat candometriosis and premenstrual syndrome, treat myalgic encephalomyelitis and chronic fatigue after viral infections, treat AIDS, multiple

The specification describes methods for desaturating a fatty acid and for producing a desaturated fatty acid by expressing increased levels o a desaturase. The present desaturase is an enzyme which introduces a double bond carbons 6 and 7 from the carboxyl end of a fatty acid molecule. The enzyme can be used for desaturating fatty acids. The enzyme can be used for desaturated fatty acids, which can be used for treating malnutrition, in pharmaceutical compositions, in cosmetics or in animal feed. The polyunsaturated fatty acids can be used for treating e.g. restenosis after angioplasty, inflammation, rheumatoid arthritis, asthma, psoriasis, cancer, diabetes or eczema or reduce hand arthritis, asthma, psoriasis, cancer, diabetes or eczema or reduce hand arthritis, asthma, psoriasis, cancer, diabetes or eczema or reduce hand arthritis, asthma, psoriasis, cancer, diabetes or eczema or reduce hand arthritis, asthma, psoriasis, cancer, diabetes or eczema or reduce hand arthritis, asthma psoriasis, cancer, diabetes or eczema or reduce hand arthritis asthma psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or reduce blood pressure. They can also be used to inhibit platelet aggregation, cause vasodilation, lower cholesterol levels, inhibit proliferation of vessel wall smooth muscle and fibrous tissue, reduce or prevent gastro-intestinal bleeding and other side effects caused by non-steroidal anti-inflammatory drugs, prevent or treat endometriosis and premenstrual syndrome, treat myslyic encephalomyelitis and chronic fatigue after viral infections, treat AIDS, multiple

                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                         AAY56045
                                                                                                                                                                           RESULT
                                                                                                                                                                                                                                                                                                                                                                                             alpha-linolenic acid to stearidonic acid. Transgenic insect cells comprising a nucleotide sequence which encodes a polypeptide comprising corresidues 50-53, 39-43, 172-176, 204-213, or 390-402 of delta-5 cc desaturase (AAY92599) or comprising delta-12 desaturase (AAY92600) are colaimed. Oil and fatty acids (especially gamma-linolenic acid) isolated from the recombinant insect cells are also claimed. Production of colling the recombinant insect cells are also claimed. Production of collyunsaturated long chain fatty acids (PUFAs) in insect cells has many collyunsaturated to external variable fluctuations, and can easily be maintained and manipulated. The oils are used in pharmaceutical compositions, infant formulas, dietary supplements or substitutes, and cosmetics (all claimed). The PUFA supplements have antiinflammatory, antidiabetic, dermatological, anti-HTV, neuroprotective, bypotensive, nephrotropic, vasodilator, antiaggregant and vasotropic

This invention describes a novel sphingolipid desaturase that selectively introduces a double bond into the sphingobase of the ceramide residue of
                                                                                                                                                                                                                                                                                                                                                                                                    Sphingolipid desaturase; sld1; sphingobase; ceramide; capnoid; transgenic plant; crop plant; delta-8-unsaturated long-chain base; tolerance; resistance; soil salinity; ion stress; toxicity; drought; cold; frost; phytopathogenic microorganism; flowering time; cosmetic; pharmaceutical; food; chemical raw material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     exclude production of delta-8-unsaturated bases, to increase tolerance or resistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms, or to alter size growth and flowering time. Cells, transgenic organisms or plants containing the DNA sequence can be used to produce sphingolipids and capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence represents a protein which has delta6 fatty acid desaturase activity which is described in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                decreased delta-8-unsaturated long-chain base content or an altered delta-8-unsaturated long-chain base cis/trans ratio, especially to compensate for a delta-8-unsaturated long-chain base deficiency, to exclude production of delta-8-unsaturated bases, to increase tolerance or resistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms, or to alter size growth and flowering time. Cells, transgenic organisms or plants containing the DNA sequence can be used to produce sphingolipids and capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence represents a protein which has delta6 fatty acid desaturase activity which is described in the method of the invention.
This invention describes a novel preparation of unsaturated fatty acids (I) by introducing into an organism at least one isolated nucleic acid (II) that encodes a polypeptide (III) with Delta6-desaturase activity. Organisms that contain at least I wt.% (I), on total fatty acid content, are then selected. (II) is selected from: (a) a 2012 bp sequence (S1), defined in the specification, or its equivalents within the degeneracy of the genetic code; or (b) derivatives of the sequence of (a) that encode a
                                                                                                                                                                                      Production of unsaturated fatty acids, useful e.g. in nutrition, cosmetics or pharmaceuticals, in organisms transformed with Physcomitrella patens delta-6-desaturase nucleic acid -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
This invention describes a novel isolated nucleic acid (I) encoding polypeptides (II) with Delta6-acetylenase and/or Delta6-desaturase activity. The invention also describes (a) amino acid sequences encoded by (I); (b) an expression cassette (EC) containing (I) linked to one or more regulatory sequences; (c) a vector containing (I) and EC; (d) organisms containing (I), EC or the vectors of (C); (e) preparation of unsaturated fatty acids (A) or triglycerides (TG) with increased content of (A) by introducing (I) or EC into an oil-producing organism; (f) production of (A) or TG by using (Ia); and (h) (A) and TG produced by method (g). (I) are used to produce transgenic plants (or other organisms) that produce oils or triglycerides (TG) with increased content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  525 amino acid polypeptide ($2), defined in the specification, or a polypeptide with at least 50% homology with ($2) and practically the same enzymatic activity. The invention also describes (1) transgenic organisms that contain (II); and (2) oils, lipids and fatty acids produced by the new method. The oils, lipids and fatty acids produced by the transformed organisms are used in human or animal nutrition, cosmetics, pharmaceuticals and agricultural chemicals. (III) can also be used, in vitro, for increasing the (I) content of triglycerides. The transgenic organisms have increased contents of (I), or of (I)-containing triglycerides, particularly of gamma-linolenic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT
                      The present sequence is a sphingolipid desaturase from clone cdelc.pk001.08:fis isolated from corn developing embryo cDNA library, cdelc. The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is also useful for producing polyclonal or monoclonal antibodies. The polynucleotide is useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of unsaturated fatty acids (A) and to isolate related sequences by homology screening. (A), or TG containing them, are useful in human nutrition (e.g. infant foods), animal feeds, pharmaceuticals and cosmetics. Derivatives of (I), e.g. antisense sequences or ribozymes, can be used to suppress expression of (II), resulting in oils with increased content of saturated fatty acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Corn; sphingolipid desaturase;

                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                            seedling root cDNA library, wrel.
The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is also useful for producing polyclonal or monoclonal antibodies. The polynucleotide is useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a sphingolipid desaturase from clone wre1.pk0004.c7:fis isolated from wheat etiolated

The delta-6 desaturase enzyme catalyses the formation of tariric acid, a fatty acid that has a triple bond at the delta-6 carbon. The present sequence is useful for producing transgenic plants having altered levels of delta-6 desaturase which in turn would alter the fatty acid composition. The enzyme is also useful for producing polyclonal or monoclonal antibodies. The polynucleotide is useful as primer or probe for screening cDNA libraries to
